## Boolean Algebra - Logical Functions

Boolean Algebra (named after mathematician, George Boole) is the mathematics associated with the binary number system and the theory of logic. It is similar to the formal algebra in the sense that it has independent variables that can produce dependent variables through functional relations established by the operations of addition and multiplication. However, the Boolean variables are binary (i.e. their domain is 1,0 ) and the Boolean operations of addition and multiplication are defined differently.

Boolean Variable X: value can only be a 1, or a 0 . Sometimes these values are referred to as true or false respectively. The convention of associating 1 with true and 0 with false is known as positive logic. The convention of associating 0 with true and 1 with false is known as negative logic. This presentation adopts positive logic.

## Boolean Addition ( + )

Boolean addition is generally known as the OR operation (logical addition)
If $\mathrm{X}, \mathrm{Y}, \mathrm{Z}$ are Boolean variables, then $\mathrm{X}+\mathrm{Y}=\mathrm{Z}$ implies the truth of X or Y produces the truth of Z . In other words, if either X or Y is true (1), then Z is true (1).

## Boolean Multiplication (.)

Boolean multiplication is generally known as the AND operation (logical multiplication) If $\mathrm{X}, \mathrm{Y}, \mathrm{Z}$ are Boolean variables, then $\mathrm{X} . \mathrm{Y}=\mathrm{Z}$ implies the truth of X and the truth of Y produces the the truth of Z . In other words, If both X and Y are true (1), then Z is true (1).

The result of Boolean operations on Boolean variables are often represented in tables called truth tables. The following are the truth tables for the OR and AND operations:

## Truth Table - OR operation (Logical addition)

| X | Y | Z |
| :--- | :--- | :--- |
| 0 | 0 | 0 |
| 0 | 1 | 1 |
| 1 | 0 | 1 |
| 1 | 1 | 1 |

## Truth Table - AND operation (Logical multiplication)

| X | Y | Z |
| :--- | :--- | :--- |
| 0 | 0 | 0 |
| 0 | 1 | 0 |
| 1 | 0 | 0 |
| 1 | 1 | 1 |

The OR and AND operations in association with the NOT operation (the compliment of $\mathrm{X}=\mathrm{X}^{\prime}$ ) form the basis of digital logic circuits constituted by gates.

## Boolean Algebra - Logical Functions

## De Morgan's Theorem

The importance of the OR, AND and NOT operations is revealed in De Morgan's Theorem:
( $\mathbf{X}+\mathbf{Y})^{\prime}=\mathbf{X}^{\prime} . \mathbf{Y}^{\prime}$
The compliment of the result of an $\mathbf{O R}$ operation on $\mathrm{X}, \mathrm{Y}=$ the result of the AND operation on their respective compliment.
( $\mathrm{X} . \mathrm{Y})^{\prime}=\mathrm{X}^{\prime}+\mathrm{X}^{\prime}$
The compliment of the result of an $\mathbf{A N D}$ operation on $\mathrm{X}, \mathrm{Y}=$ the result of the $\mathbf{O R}$ operation on their respective compliment.
The implication of De Morgan's Theorem is that any logical function can be obtained by either the OR operation and the NOT (compliment) operation, or by the AND operation and the NOT operation. Consequently, there are two families of logical functions: sums of products and product of sums.

## Some Important Rules Of Boolean Algebra

Rule 1: $\quad 0+\mathrm{X}=\mathrm{X}$
Rule 2: $\quad 1+X=1$
Rule 3: $\quad \mathrm{X}+\mathrm{X}=\mathrm{X}$
Rule 4: $\quad X+X^{\prime}=1$
where X ' is the compliment of X
Rule 5: $\quad 0 . X=0$
Rule 6: $1 . \mathrm{X}=\mathrm{X}$
Rule 7: $\quad \mathrm{X} . \mathrm{X}=\mathrm{X}$
Rule 8: $\quad \mathrm{X} . \mathrm{X}^{\prime}=0$
Rule 9: $\quad \mathrm{X}$ ', $\mathrm{X}=\mathrm{X}$
Rule 10: $\quad \mathrm{X}+\mathrm{Y}=\mathrm{Y}+\mathrm{X}$
Rule 11: $\mathrm{X} . \mathrm{Y}=\mathrm{Y} . \mathrm{X}$
Rule 12: $\quad \mathrm{X}+(\mathrm{Y}+\mathrm{Z})=(\mathrm{X}+\mathrm{Y})+\mathrm{Z}$
Rule 13: $\mathrm{X} .(\mathrm{Y} . \mathrm{Z})=(\mathrm{X} . \mathrm{Y}) . \mathrm{Z}$
Rule 14: $\mathrm{X} .(\mathrm{Y}+\mathrm{Z})=\mathrm{X} . \mathrm{Y}+\mathrm{X} . \mathrm{Z}$
where X " is the double compliment of X
Commutative Law
Commutative Law
Associative Law
Associative Law
Distributive Law
Rule 15: $\quad \mathrm{X}+\mathrm{X} . \mathrm{Z}=\mathrm{X}$
Rule 16: $\quad \mathrm{X} .(\mathrm{X}+\mathrm{Y})=\mathrm{X}$
Rule 17: $(\mathrm{X}+\mathrm{Y}) .(\mathrm{X}+\mathrm{Z})=\mathrm{X}+\mathrm{Y} . \mathrm{Z}$
Rule 18: $\mathrm{X}+\mathrm{X}$ ' . $\mathrm{Y}=\mathrm{X}+\mathrm{Y}$
Rule 19: $\quad \mathrm{X} . \mathrm{Y}+\mathrm{Y} . \mathrm{Z}+\mathrm{X}^{\prime} . \mathrm{Z}=\mathrm{X} . \mathrm{Y}+\mathrm{X}^{\prime} . \mathrm{Z}$

## Boolean Algebra - Logical Functions

(1) Use truth tables to prove that $\mathrm{BC}+\mathrm{BC}^{\prime}+\mathrm{B}$ ' $\mathrm{A}=\mathrm{A}+\mathrm{B}$

Ans (1)

| A | B | C | BC | BC' | B'A $^{\prime}$ | $\mathrm{BC}+\mathrm{BC}{ }^{\prime}+\mathrm{B}^{\prime} \mathrm{A}$ | $\mathrm{A}+\mathrm{B}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| 0 | 0 | 1 | 0 | 0 | 0 | 0 | 0 |
| 0 | 1 | 0 | 0 | 1 | 0 | 1 | 1 |
| 0 | 1 | 1 | 1 | 0 | 0 | 1 | 1 |
| 1 | 0 | 0 | 0 | 0 | 1 | 1 | 1 |
| 1 | 0 | 1 | 0 | 0 | 1 | 1 | 1 |
| 1 | 1 | 0 | 0 | 1 | 0 | 1 | 1 |
| 1 | 1 | 1 | 1 | 0 | 0 | 1 | 1 |

(2) Simplify the expression: $f(A, B, C, D)=A B C+A^{\prime} C D+B^{\prime} C D$.

Ans (2) $f(A, B, C, D)=A B C+C D\left(A^{\prime}+B^{\prime}\right)$.
(3) $F$ is a Boolean function that is the result of a AND operation on $f_{1}(A, B), f_{2}(C, D), f_{3}(E)$.
$\mathrm{f}_{1}(\mathrm{~A}, \mathrm{~B})$ is the result of a NAND operation on A, B
$\mathrm{f}_{2}(\mathrm{C}, \mathrm{D})$ is the result of a NAND operation on C, D
$f_{3}(E)$ is the result of a NOT operation on $E$
Determine the expression for F .

```
Ans (3) \(f_{1}(A, B)=(A . B)^{\prime} \quad\) The compliment of A . B \(\mathrm{f}_{2}(\mathrm{C}, \mathrm{D})=(\mathrm{C} . \mathrm{D})^{\prime} \quad\) The compliment of C. D \(\mathrm{f}_{3}(\mathrm{E})=\mathrm{E}, \quad\) The compliment of E
```

So, $\mathrm{F}=(\mathrm{AB})^{\prime} .(\mathrm{C} \mathrm{D})^{\prime} . \mathrm{E}^{\prime}=(\mathrm{AB}+\mathrm{CD}+\mathrm{E})^{\prime}$
(4) Three commissioners constitute the board of a small county. Each commissioner votes on measures presented to the board by pressing a button indicating whether the commissioner votes for or against a measure. A measures passes if two or more commissioners vote for it. Design a logic circuit that takes the three votes as inputs and lights either a green or a red light to indicate whether a measure passes.

Ans (4) Let the vote of each of the three commissioners be Boolean variables X, Y, Z. Where $\mathrm{X}=1$ implies that commissioner X votes for measure; and $\mathrm{X}=0$, commissioner X votes against measure. Similarly for variables Y, Z. Then the logic circuit consists of three AND operations on each of the variable pairs ( $\mathrm{X}, \mathrm{Y}$ ), ( $\mathrm{X}, \mathrm{Z}$ ), ( $\mathrm{Y}, \mathrm{Z}$ ); and one $\mathbf{O R}$ operation on the results $\mathrm{XY}, \mathrm{XZ}$, and YZ from the AND operations. In other words, XY, XZ, YZ are inputs for the OR operation. So, the Boolean logic function describing the circuit $=\mathrm{F}(\mathrm{X}, \mathrm{Y}, \mathrm{Z})=\mathrm{XY}+\mathrm{XZ}+\mathrm{YZ}$. Logic gates can be used to illustrate the Boolean logic function, however they are left out deliberately in this presentation because their absence necessitates more abstract thinking.

## Boolean Algebra - Logical Functions

(5) State the sum of products expression for the Boolean variables, X,Y, Z, W. What basic Boolean operations produce the expression?

Ans (5) Sum of products expression: (X.Y) + (Z.W). Two AND operations and one OR operation produce the sum of products expression.
(6) State the product of sums expression for the Boolean variables, A, B, C, D. What basic Boolean operations produce the expression?

Ans (6) Product of sums expression: (A + B).( $\mathrm{C}+\mathrm{D}$ ). Two OR operations and one AND operation produce the product of sums expression.
Its been mentioned earlier, that any logical expression can be reduced to either sum of products expression or the product of sums expression. The two forms are equivalent, one may have a simplier implementation over the other in a given logic circuit design.
(7) Consider a fail-safe autopilot system in a commercial aircraft. The system check must pass before takeoff or landing maneuver. The system check passes when the following conditions are satisfied: two of the three (pilot, copilot and autopilot) possible pilots must be available; there is a signal test that confirms the pilot and copilot are seated properly in their respective control seat; the autopilot system can self-check to verify that its in proper operational state. Let the Boolean variable X denotes the pilot state ( 1 if the pilot is sitting at the controls), Y denote the same condition for the copilot, and Z denote the state of the autopilot ( 1 indicates the autopilot is functioning properly). Determine the logic function that establishes system ready (i.e. positive check - system check passes).

Ans (7) Required function $\mathrm{f}(\mathrm{X}, \mathrm{Y}, \mathrm{Z})=\mathrm{X} . \mathrm{Y}+\mathrm{X} . \mathrm{Z}+\mathrm{Y} . \mathrm{Z}$
In order to determine the logic function for system fails, we apply De Morgan's Theorem to f , which is in sum of products form. So, logic function g , for system fails (negative check) is: $\mathrm{g}=\mathrm{f}^{\prime}=(\mathrm{X} . \mathrm{Y}+\mathrm{X} . \mathrm{Z}+\mathrm{Y} . \mathrm{Z})^{\prime}=\left(\mathrm{X}^{\prime}+\mathrm{Y}^{\prime}\right) \cdot\left(\mathrm{X}^{\prime}+\mathrm{Z}^{\prime}\right) \cdot\left(\mathrm{Y}^{\prime}+\mathrm{Z}^{\prime}\right), \mathrm{g}$ is product of sums.
